Research Paper

Ty Brennan, Dr. Ashforth March 20, 2023

Topic(s):

- 1. Enforcing Supercriticality in Hopfield neural networks
- 2. AIRR
- 3. Using Reinforcement learning methods to train Energy Based Neural Networks
- 4. Using Sparse Hopfield networks for Immune Repatoire Classification
- 5. Sparse Hopfield Neural Networks for Deep learning
- 6. Boltzmann machines
- 7. Biologically plausiable neural network

$$E = -\operatorname{lse}(\beta, \mathbf{X}^T \boldsymbol{\xi}) + \frac{1}{2} \boldsymbol{\xi}^T \boldsymbol{\xi} + \beta^{-1} \log N + \frac{1}{2} M^2$$

$$E_1(\boldsymbol{\xi}) = \frac{1}{2} \boldsymbol{\xi}^T \boldsymbol{\xi}$$

$$E_2(\boldsymbol{\xi}) = -\operatorname{lse}(\beta, \mathbf{X}^T \boldsymbol{\xi})$$

$$\nabla_{\boldsymbol{\xi}} E_1^{t+1} = -\nabla_{\boldsymbol{\xi}} E_2^t$$

NOTES

- Hopfield update rule: $\xi^{t+1} = \operatorname{sgn}(W\xi^t b)$
- Modern Hopfield Energy func: $E = -\sum_{i=1}^{N} F(x_i^T \xi)$ where can be $F = \exp$
- The above energy can also be written as $-\exp(\operatorname{lse}(1, X^T\xi))$
- Modern Hopfield update rule: $\xi^{new}[l] = \text{sgn}[-E(\xi^{(l+)} + E(\xi^{(l-)})]$

- Continuous Valued Energy function: $-\mathrm{lse}(\beta, X^T\xi) + \frac{1}{2}\xi^T\xi + \beta^{-1}\log N + \frac{1}{2}M^2$, which is the log of the negative energy above.
- $\nabla_{\xi}(\frac{1}{2}\xi^{T}\xi) = \mathbf{1}$ and $-\nabla_{\xi}\mathrm{lse}(\beta, X^{T}\xi) = X\mathrm{softmax}(\beta X^{T}\xi)$, which means that $\xi^{new} = X\mathrm{softmax}(\beta X^{T}\xi)$, which is the new update procedure.
- The above update rule can be generalized to $\Xi^{new} = X \operatorname{softmax}(\beta X^T \Xi)$
